Gravity from squaring Yang-Mills

Michael Duff
Imperial College London
based on
A. Anastasiou, L. Borsten, M. J. Duff, L. J. Hughes and S. Nagy]

Erice, June 2014
1.1 Aims

- MATHEMATICS:
  \[(DIVISION\ ALGEBRAS)^2 = MAGIC\ SQUARE\ OF\ LIE\ ALGEBRAS\]

- PHYSICS:
  \[(YANG - MILLS)^2 = MAGIC\ SQUARE\ OF\ SUPERGRAVITIES\]

RESULT:

\[MATHEMATICS\ MAGIC\ SQUARE = PHYSICS\ MAGIC\ SQUARE\]
1.2 Division algebras

- Mathematicians deal with four kinds of numbers, called Division Algebras.
- The Octonions occupy a privileged position:

<table>
<thead>

**Table: Magic square**

- Despite much effort, however, it is fair to say that the ultimate physical significance of octonions and the magic square remains an enigma.
1.5 Comment

There are different magic squares depending on the choice of real forms. Ours should not to be confused with other versions that have appeared in the so-called ”magic” supergravities in $D = 4, 5, 6$ [Gunaydin, Sierra and Townsend 1983]

The specific square of real forms we derive from the triality construction was first obtained in [Cacciatori-Cerchiai-Marrani:2012] using a “Lorentizian Jordan algebra” adaptation of the Tits formula [Tits:1962]
1.6 Earlier work involving octonions

- For earlier work on octonions in high-energy physics, see, for example,
  
  [ Kugo and Townsend: 1983
  Gunaydin, Sierra and Townsend: 1983
  Fubini and Nicolai: 1985
  MJD: 1986
  Fairlie and Manogue 1987
  Berkovits: 1993
  Evans: 1994
  Gunaydin and Nicolai: 1995
  Baez: 2001
  Barton and Sudbery: 2003
  Feingold, Kleinschmidt and Nicolai: 2008
  Baez: 2009
  MJD et al: 2013]

- Despite much effort, however, it is fair to say that the ultimate physical significance of octonions and the magic square remains an enigma.
1.7 Squaring Yang-Mills

- In apparently different developments, a recurring theme in attempts to understand the quantum theory of gravity is the idea of “Gravity as the square of Yang-Mills”.

- This idea of tensoring left ($L$) and right ($R$) multiplets appears in many different (but sometimes overlapping) guises. For example:
  - KLT relations in string theory [Kawai et al:1985]
  - $D = 10$ dimensional Type IIA and IIB supergravity (SG) multiplets from $D = 10$ super Yang-Mills (SYM) multiplets [Green et al:1987]
  - Asymmetric orbifold constructions [Sen and Vafa:1995]
  - Gravity anomalies from gauge anomalies [Antoniadis et al:1992]
In D=10 Type IIA comes from the product of two Yang-Mills multiplets of opposite chirality with SO(8) reps.

\[
\begin{array}{ccc}
8_v & 8_s \\
8_v & 1 + 28 + 35_v & 8_c + 56_c \\
8_c & 8_s + 56_s & 8_v + 56_v \\
\end{array}
\]

**Table:** SO(8) reps of D=10 Type IIA supergravity

\[
\begin{array}{ccc}
A_M & \chi^s \\
A_N & \phi + B_{MN} + g_{MN} & \psi^c_N + \chi^c \\
\chi^c & \psi^s_M + \chi^s & A_P + A_{PQR} \\
\end{array}
\]

**Table:** Fields of D=10 Type IIA supergravity
1.9 Squaring D=10 Yang Mills to get TypeIIB supergravity

In D=10 Type IIB comes from the product of two Yang-Mills multiplets of same chirality with SO(8) reps.

\[
\begin{array}{cc}
8_v & 8_c \\
8_v & 1 + 28 + 35_v \\
8_c & 8_s + 56_s \\
8_c & 8_s + 56_s \\
8_c & 1 + 28 + 35_c \\
\end{array}
\]

Table : SO(8) reps of D=10 Type IIB supergravity

<table>

</table>

Table : Fields of D=10 Type IIB supergravity
1.10 Summary Yang-Mills

- We give a unified description of
  \( D = 3 \) Yang-Mills with \( \mathcal{N} = 1, 2, 4, 8 \)
  \( D = 4 \) Yang-Mills with \( \mathcal{N} = 1, 2, 4 \)
  \( D = 6 \) Yang-Mills with \( \mathcal{N} = 1, 2 \)
  \( D = 10 \) Yang-Mills with \( \mathcal{N} = 1 \)
in terms of a pair of division algebras \((\mathbb{A}_n, \mathbb{A}_{nN})\), \( n = D - 2 \)
- We present a master Lagrangian, defined over \( \mathbb{A}_{nN} \)-valued fields, which encapsulates all cases.
- The overall (spacetime plus internal) on-shell symmetries are given by the corresponding triality algebras.
- We use imaginary \( \mathbb{A}_{n\mathcal{N}} \)-valued auxiliary fields to close the non-maximal supersymmetry algebra off-shell. The failure to close off-shell for maximally supersymmetric theories is attributed directly to the non-associativity of the octonions.
1.11 Summary Gravity Magic Square in $D = 3$

In $D = 3$ tensoring $\mathcal{N}_L = 1, 2, 4, 8$ and $\mathcal{N}_R = 1, 2, 4, 8$ Yang-Mills multiplets yields a $4 \times 4$ square description of supergravities with $\mathcal{N} = 2, 3, 4, 5, 6, 8, 9, 10, 12, 16$.

- **RR RC RH RO**  \quad 2  \quad 3  \quad 5  \quad 9  
- **CR CC CH CO**  \quad 3  \quad 4  \quad 6  \quad 10  
- **HR HC HH HO**  \quad 5  \quad 6  \quad 8  \quad 12  
- **OR OC OH OO**  \quad 9  \quad 10  \quad 12  \quad 16  

The $G/H$ U-duality groups are precisely those of the Freudenthal Magic Square!

\begin{align*}
G : \quad & g_3(\mathbb{A}_L, \mathbb{A}_R) := \text{tri}(\mathbb{A}_L) + \text{tri}(\mathbb{A}_R) + 3(\mathbb{A}_L \times \mathbb{A}_R). \\
H : \quad & g_1(\mathbb{A}_L, \mathbb{A}_R) := \text{tri}(\mathbb{A}_L) + \text{tri}(\mathbb{A}_R) + (\mathbb{A}_L \times \mathbb{A}_R). 
\end{align*}
BUT there is also a more familiar \( \mathbb{R}, \mathbb{C}, \mathbb{H}, \mathbb{O} \) description of spacetime in \( D = 3, 4, 6, 10 \). Tensoring left and right yields:

- \( D = 3 \) A magic \( 4 \times 4 \) square \( \mathbb{R} \mathbb{R}, \mathbb{C} \mathbb{R}, \mathbb{C} \mathbb{C}, \mathbb{H} \mathbb{R}, \mathbb{H} \mathbb{C}, \mathbb{H} \mathbb{H}, \mathbb{O} \mathbb{R}, \mathbb{O} \mathbb{C}, \mathbb{O} \mathbb{H}, \mathbb{O} \mathbb{O} \) description of supergravities with \( \mathcal{N} = 2, 3, 4, 5, 6, 8, 9, 10, 12, 16 \).
- \( D = 4 \) A \( 3 \times 3 \) square \( \mathbb{R} \mathbb{R}, \mathbb{C} \mathbb{R}, \mathbb{C} \mathbb{C}, \mathbb{H} \mathbb{R}, \mathbb{H} \mathbb{C}, \mathbb{H} \mathbb{H} \) description of supergravities with \( \mathcal{N} = 2, 3, 4, 5, 6, 8 \).
- \( D = 6 \) A \( 2 \times 2 \) square \( \mathbb{R} \mathbb{R}, \mathbb{C} \mathbb{R}, \mathbb{C} \mathbb{C} \) description of supergravities with \( \mathcal{N} = 2, 3, 4 \).
- \( D = 10 \) A \( 1 \times 1 \) square \( \mathbb{R} \mathbb{R} \) description of supergravities with \( \mathcal{N} = 2 \).

Together these form *The Magic Pyramid*.

The corresponding U-duality groups are given by a new algebraic structure, the magic pyramid formula, which may be regarded as being defined over three division algebras, one for spacetime and each of the left/right Yang-Mills multiplets.
We also construct a conformal magic pyramid by tensoring conformal supermultiplets in $D = 3, 4, 6$.

The missing entry in $D = 10$ is suggestive of an exotic theory with G/H duality structure $F_{4(4)}/Sp(3) \times Sp(1)$. 

2.1 Octonions

- An element $x \in O$ may be written $x = x^a e_a$, where $a = 0, \ldots, 7$, $x^a \in \mathbb{R}$ and $\{e_a\}$ is a basis with one real $e_0 = 1$ and seven $e_i$, $i = 1, \ldots, 7$ imaginary elements. The octonionic conjugation is denoted by $e_a^*$, where $e_0^* = e_0$ and $e_i^* = -e_i$.

- The octonionic multiplication rule is,

$$e_a e_b = (\delta_{a0} \delta_{bc} + \delta_{0b} \delta_{ac} - \delta_{ab} \delta_{0c} + C_{abc}) e_c,$$

where $C_{abc}$ is totally antisymmetric such that $C_{0bc} = 0$. The non-zero $C_{ijk}$ are the octonionic structure constants:

$$C_{ijk} = \varepsilon_{ijk} \text{ if } ijk \in L$$

with $L$ the set of oriented lines of the Fano plane. See [Baez:2001].

$$L = \{124, 235, 346, 457, 561, 672, 713\}.$$
The Fano plane has seven points and seven lines (the circle counts as a line) with three points on every line and three lines through every point.
Gino Fano (5 January 1871 to 8 November 1952) was an Italian mathematician. He was born in Mantua and died in Verona. Fano worked on projective and algebraic geometry; the Fano plane, Fano fibration, Fano surface, and Fano varieties are named for him. Ugo Fano and Robert Fano were his sons.
2.4 Cayley-Dickson

\[ O = O^0 e_0 + O^1 e_1 + O^2 e_2 + O^3 e_3 + O^4 e_4 + O^5 e_5 + O^6 e_6 + O^7 e_7 \]
\[ = H(0) + e_3 H(1) \]

\[ H(0) = O^0 e_0 + O^1 e_1 + O^2 e_2 + O^4 e_4 \quad H(1) = O^3 e_0 - O^7 e_1 - O^5 e_2 + O^6 e_4 \]
\[ H(0) = C(00) + e_2 C(10) \quad H(1) = C(01) + e_2 C(11) \]

\[ C(00) = O^0 e_0 + O^1 e_1 \quad C(01) = O^3 e_0 - O^7 e_1 \]
\[ C(10) = O^2 e_0 - O^4 e_1 \quad C(11) = -O^5 e_0 - O^6 e_1 \]
\[ C(00) = R(000) + e_1 R(100) \quad C(01) = R(001) + e_1 R(101) \]
\[ C(10) = R(010) + e_1 (110) \quad C(11) = R(011) + e_1 R(111) \]

\[ R(000) = O^0 \quad R(100) = O^1 \quad R(001) = O^3 \quad R(101) = -O^7 \]
\[ R(010) = O^2 \quad R(110) = -O^4 \quad R(011) = -O^5 \quad R(111) = -O^6 \]
2.5 Division algebras

- Division: \( ax + b = 0 \) has a unique solution
- Associative: \( a(bc) = (ab)c \)
- Commutative: \( ab = ba \)

It will also be useful to define $Q_{ijkl}$, which is equal to 1 ($-1$) when $ijkl$ is an even (odd) permutation of an element of $Q$, the set of oriented quadrangles in the Fano plane:

$$Q = \{3567, 4671, 5712, 6123, 7234, 1345, 2456\},$$

and equal to zero otherwise. Equivalently, we can define $Q_{ijkl}$ by

$$Q_{ijkl} = -\frac{1}{3!} C_{mnp} \varepsilon_{mnpijkl}.$$
2.7 The Associator

- The octonions have a trilinear map called the associator given by:

\[
[x, y, z] = (xy)z - x(yz)
\]

which measures the failure of associativity.

- In the same way that the multiplication of the octonionic bases was realised using the lines of the Fano plane, the associator of three octonionic bases can be realised using its quadrangles \( Q \):

\[
[e_a, e_b, e_c] = 2Q_{abcd}e_d
\]

The object \( Q_{abcd} \) is totally antisymmetric with \( Q_{0ijk} = C_{ijk} \).

\[
Q_{abcd} = \frac{1}{4!} \epsilon_{abcdefg}Q^{efgh}
\]
To understand the symmetries of the magic square and its relation to YM we shall need in particular two algebras defined on $\mathbb{A}$.

First, the algebra $\text{norm}(\mathbb{A})$ that preserves the norm

$$\langle x | y \rangle := \frac{1}{2} (xy + yx) = x^a y^b \delta_{ab}$$

- $\text{norm}(\mathbb{R}) = 0$
- $\text{norm}(\mathbb{C}) = \text{so}(2)$
- $\text{norm}(\mathbb{H}) = \text{so}(4)$
- $\text{norm}(\mathbb{O}) = \text{so}(8)$
Second, the triality algebra $\text{tri}(A)$

$$\text{tri}(A) \equiv \{(A, B, C)|A(xy) = B(x)y + xC(y)\}, \quad A, B, C \in \mathfrak{so}(n), \quad x, y \in A.$$ 

$$\text{tri}(\mathbb{R}) = 0$$

$$\text{tri}(\mathbb{C}) = \mathfrak{so}(2) + \mathfrak{so}(2)$$

$$\text{tri}(\mathbb{H}) = \mathfrak{so}(3) + \mathfrak{so}(3) + \mathfrak{so}(3)$$

$$\text{tri}(\mathbb{O}) = \mathfrak{so}(8)$$

[Barton and Sudbery:2003]:
In $D = 4$ the Pauli matrices $\{\bar{\sigma}_\mu\}$ are used as a basis for Hermitian matrices, so that we can write $X = X^\mu \bar{\sigma}_\mu$. This suggests a generalised set of Pauli matrices for $\mu = 0, 1, \ldots, (n + 1)$.

$$\bar{\sigma}_\mu = \sigma^\mu = (+1, \sigma_{a+1}, \sigma_{n+1}),$$
$$\sigma_\mu = \bar{\sigma}^\mu = (-1, \sigma_{a+1}, \sigma_{n+1}),$$

where

$$\sigma_{a+1} = \begin{pmatrix} 0 & e^*_a \\ e_a & 0 \end{pmatrix}, \quad \sigma_{n+1} = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}.$$ 

The notation is chosen so that in $D = 4$ (where $n = 2$ and $\mathbb{A} = \mathbb{C}$) the matrices reduce to the usual Pauli set:

$$\sigma_1 = \begin{pmatrix} 0 & e^*_0 \\ e_0 & 0 \end{pmatrix} = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}, \quad \sigma_2 = \begin{pmatrix} 0 & e^*_1 \\ e_1 & 0 \end{pmatrix} = \begin{pmatrix} 0 & -i \\ i & 0 \end{pmatrix}, \quad \sigma_3 = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}.$$
It is easy to see that these generalised Pauli matrices satisfy the required algebra:

\[ \sigma^\mu \bar{\sigma}^\nu + \sigma^\nu \bar{\sigma}^\mu = 2\eta^{\mu\nu} 1, \]
\[ \bar{\sigma}^\mu \sigma^\nu + \bar{\sigma}^\nu \sigma^\mu = 2\eta^{\mu\nu} 1. \]

As a result, they can be used to construct Lorentz generators of the spinor and conjugate spinor representations.
2.12 Spinors

- When $A = \mathbb{R}$, $S_+ \sim S_-$, $\Psi$ is the Majorana spinor in $D = 3$
- When $A = \mathbb{C}$, $S_+$ and $S_-$, $\Psi$ and $\chi$ are the Weyl spinors in $D = 4$
- When $A = \mathbb{H}$, $S_+$ and $S_-$, $\Psi$ and $\chi$ are the Symplectic-Weyl spinors in $D = 6$
- When $A = \mathbb{O}$, $S_+$ and $S_-$, $\Psi$ and $\chi$ are the Majorana-Weyl spinors in $D = 10$.

The Lorentz transformations are:

\[
\delta \Psi = \frac{1}{4} \lambda^{\mu\nu} \sigma_{\mu\nu} \Psi = \frac{1}{4} \lambda^{\mu\nu} \sigma_\mu \bar{\sigma}_\nu \Psi, \\
\delta \chi = \frac{1}{4} \lambda^{\mu\nu} \bar{\sigma}_{\mu\nu} \chi = \frac{1}{4} \lambda^{\mu\nu} \bar{\sigma}_\mu \sigma_\nu \chi.
\] (1)

Note that for $A = \mathbb{O}$, the choice of association $(\sigma_{[\mu} \bar{\sigma}_{\nu]} \Psi$ is wrong, this gives only 31 independent generators when we expect $45 = \dim[SO(1, 9)]$.

- The 14 generators we are missing are the generators of $G_2$, the automorphism group of the octonions. It is fairly straightforward to check that the correct answer is given by $\sigma_{[\mu} (\bar{\sigma}_{\nu]} \Psi)$.
The $D = 3, \mathcal{N} = 8$ super YM action is given by

$$S = \int d^3x \left( -\frac{1}{4} F^A_{\mu\nu} F^{A\mu\nu} - \frac{1}{2} D_\mu \phi_i^A D^\mu \phi_i^A + i \bar{\lambda}_a^A \gamma^\mu D_\mu \lambda_a^A - \frac{1}{4} g^2 f_{BC}^A f_{DE}^A \phi_i^B \phi_i^D \phi_j^C \phi_j^E - gf_{BC}^A \phi_i^B \bar{\lambda}_a^A \Gamma_{ab}^i \lambda^C_b \right),$$

where the Dirac matrices $\Gamma_{ab}^i$, $i = 1, \ldots, 7$, $a, b = 0, \ldots, 7$, belong to the SO(7) Clifford algebra.

The key observation is that $\Gamma_{ab}^i$ can be represented by the octonionic structure constants,

$$\Gamma_{ab}^i = i(\delta_{bi} \delta_{a0} - \delta_{b0} \delta_{ai} + C_{iab}),$$

which allows us to rewrite the action over octonionic fields.
3.2 \( A = \mathbb{R}, \mathbb{C}, \mathbb{H}, \mathbb{O} \rightarrow \mathcal{N} = 1, 2, 4, 8 \) supersymmetries

- If we replace \( \mathbb{O} \) with a general division algebra \( \mathbb{A} \), the result is \( \mathcal{N} = 1, 2, 4, 8 \) over \( \mathbb{R}, \mathbb{C}, \mathbb{H}, \mathbb{O} \):

\[
S = \int d^3x \left( -\frac{1}{4} F_{\mu\nu}^A F^{A\mu\nu} - \frac{1}{2} D_\mu \phi^A \phi^A + i \overline{\lambda}^A \gamma^\mu D_\mu \lambda^A 
- \frac{1}{4} g^2 f_{BC}^A f_{DE}^A \langle \phi^B | \phi^D \rangle \langle \phi^C | \phi^E \rangle 
+ \frac{i}{2} gf_{BC}^A \left( (\overline{\lambda}^A \phi^B) \lambda^C - \overline{\lambda}^A (\phi^B \lambda^C) \right) \right),
\]

where \( \phi = \phi^i e_i \) is an \( \text{Im} \mathbb{A} \)-valued scalar field, \( \lambda = \lambda^a e_a \) is an \( \mathbb{A} \)-valued two-component spinor and \( \overline{\lambda} = \overline{\lambda}^a e^*_a \).

- Note, since \( \lambda^a \) is anti-commuting we are dealing with the algebra of octonions defined over the Grassmanns.
3.3 Transformation rules

- The supersymmetry transformations in this language are given by

\[
\delta \lambda^A = \frac{1}{2} (F^{A\mu\nu} + \epsilon^{\mu\nu\rho} D_\rho \phi^A) \sigma_{\mu\nu} \epsilon + \frac{1}{2} g f_{BC}^{\phi} \phi_i^B \phi_j^C \sigma_{ij} \epsilon,
\]

\[
\delta A^A_\mu = -\frac{i}{2} (\bar{\epsilon} \gamma_\mu \lambda^A - \bar{\lambda}^A \gamma_\mu \epsilon),
\]

\[
\delta \phi^A = -\frac{i}{2} e_i [(\bar{\epsilon} e_i) \lambda^A - \bar{\lambda}^A (e_i \epsilon)],
\]

where \(\sigma_{\mu\nu}\) are the generators of \(\text{SL}(2, \mathbb{R}) \cong \text{SO}(1, 2)\).
4.1 Magic square of non-compact groups $G$

- For the purposes of squaring YM a manifestly $A_L \leftrightarrow A_R$ symmetric formulation of the square is required. This is achieved by adapting the *triality algebra* construction introduced by Barton and Sudbery [Barton and Sudbery:2003, MJD et al:2013].

- Our definition is given by

$$g_3(A_L, A_R) := \text{tri}(A_L) + \text{tri}(A_R) + 3(A_L \times A_R).$$

<table>
<thead>

**Table:** Magic square

- eg

$$E_8(8) = SO(8) + SO(8) + 3(\mathbb{O} \times \mathbb{O})$$

$$248 = 28 + 28 + (8_v, 8_v) + (8_s, 8_s) + (8_c, 8_c)$$
4.4 Magic square of maximal compact subalgebras $H$

- We shall also need a magic square of the maximal compact subalgebras. This is given by the *reduced* triality construction,

$$g_1(\mathcal{A}_L, \mathcal{A}_R) := \text{tri}(\mathcal{A}_L) + \text{tri}(\mathcal{A}_R) + (\mathcal{A}_L \times \mathcal{A}_R),$$

<table>
<thead>

*Table: Magic square of maximal compact subalgebras.*
5.1 Squaring $\mathbb{R}, \mathbb{C}, \mathbb{H}, \mathbb{O}$ Yang-Mills

- Having cast the magic square in terms of a manifestly $\mathbb{A}_L \leftrightarrow \mathbb{A}_R$ symmetric triality algebra construction, and having written $\mathcal{N} = 1, 2, 4, 8$ YM in terms of fields valued in $\mathbb{R}, \mathbb{C}, \mathbb{H}, \mathbb{O}$ we shall now obtain the magic square of supergravities by “squaring” $\mathcal{N} = 1, 2, 4, 8$ YM.

- In the supersymmetric context it is not difficult to see that the amount of supersymmetry is given by

$$[\mathcal{N}_L \text{ SYM}] \times [\mathcal{N}_R \text{ SYM}] \rightarrow [\mathcal{N} = \mathcal{N}_L + \mathcal{N}_R \text{ SG}],$$

- It is harder to see how the other gravitational symmetries arise from those of Yang-Mills. For example $D = 4, N = 8$ supergravity has a global non-compact symmetry (U-duality) $E_{7(7)}$ and a local compact symmetry $SU(8)$, whereas $D = 4, N = 4$ super Yang-Mills has global $SU(4)$ R-symmetry.
5.2 U-dualities of supergravity

Table: The symmetry groups ($G$) of the low energy supergravity theories with 32 supercharges in different dimensions ($D$) and their maximal compact subgroups ($H$). In each $D$ one may truncate to lower $\mathcal{N}$ to get smaller $G$ and $H$.

The scalars belong to the space $G/H$
5.3 Squaring $\mathbb{R}, \mathbb{C}, \mathbb{H}, \mathbb{O}$ Yang-Mills in $D = 3$

Taking a left SYM multiplet

$$\{A_\mu(L) \in \text{Re}A_L, \quad \phi(L) \in \text{Im}A_L, \quad \lambda(L) \in A_L\}$$

and tensoring with a right multiplet

$$\{A_\mu(R) \in \text{Re}A_R, \quad \phi(R) \in \text{Im}A_R, \quad \lambda(R) \in A_R\}$$

we obtain the field content of a supergravity theory valued in both $A_L$ and $A_R$:

<table>
<thead>
<tr>
<th>$A_L/A_R$</th>
<th>$A_\mu(R) \in \text{Re}A_R$</th>
<th>$\phi(R) \in \text{Im}A_R$</th>
<th>$\lambda(R) \in A_R$</th>
</tr>
</thead>
<tbody>
<tr>
<td>$A_\mu(L) \in \text{Re}A_L$</td>
<td>$g_{\mu\nu} + \varphi \in \text{Re}A_L \otimes \text{Re}A_R$</td>
<td>$\varphi \in \text{Re}A_L \otimes \text{Im}A_R$</td>
<td>$\Psi_\mu + \chi \in \text{Re}A_L \otimes A_R$</td>
</tr>
<tr>
<td>$\phi(L) \in \text{Im}A_L$</td>
<td>$\varphi \in \text{Im}A_L \otimes \text{Re}A_R$</td>
<td>$\varphi \in \text{Im}A_L \otimes \text{Im}A_R$</td>
<td>$\chi \in A_L \otimes A_R$</td>
</tr>
<tr>
<td>$\lambda(L) \in A_L$</td>
<td>$\Psi_\mu + \chi \in A_L \otimes \text{Re}A_R$</td>
<td>$\chi \in A_L \otimes \text{Im}A_R$</td>
<td>$\varphi \in A_L \otimes A_R$</td>
</tr>
</tbody>
</table>

Grouping spacetime fields of the same type we find,

$$g_{\mu\nu} \in \mathbb{R}, \quad \Psi_\mu \in \left(\frac{A_L}{A_R}\right), \quad \varphi \in \left(\frac{A_L \otimes A_R}{A_L \otimes A_R}\right), \quad \chi \in \left(\frac{A_L \otimes A_R}{A_L \otimes A_R}\right)$$
5.4 Grouping together

- Grouping spacetime fields of the same type we find,

\[ g_{\mu\nu} \in \mathbb{R}, \quad \psi_\mu \in \left( \frac{\mathbb{A}_L}{\mathbb{A}_R} \right), \quad \varphi, \chi \in \left( \frac{\mathbb{A}_L \otimes \mathbb{A}_R}{\mathbb{A}_L \otimes \mathbb{A}_R} \right). \quad (3) \]

- Note we have dualised all resulting \( p \)-forms, in particular vectors to scalars. The \( \mathbb{R} \)-valued graviton and \( \mathbb{A}_L \oplus \mathbb{A}_R \)-valued gravitino carry no degrees of freedom. The \( (\mathbb{A}_L \otimes \mathbb{A}_R)^2 \)-valued scalar and Majorana spinor each have \( 2 (\dim \mathbb{A}_L \times \dim \mathbb{A}_R) \) degrees of freedom.

- Fortunately, \( \mathbb{A}_L \oplus \mathbb{A}_R \) and \( (\mathbb{A}_L \otimes \mathbb{A}_R)^2 \) are precisely the representation spaces of the vector and (conjugate) spinor. For example, in the maximal case of \( \mathbb{A}_L, \mathbb{A}_R = \mathbb{O} \), we have the \( 16, 128 \) and \( 128' \) of \( \text{SO}(16) \).
5.5 U-dualities from division algebras

- U-dualities $G$ are realised non-linearly on the scalars, which parametrise the symmetric spaces $G/H$.
- This can be understood using the remarkable identity relating the projective planes over $(A_L \otimes A_R)^2$ to $G/H$,

$$(A_L \otimes A_R)P^2 \cong G/H.$$ 

The scalar fields may be regarded as points in division-algebraic projective planes [Baez:2001, Freudenthal:1964, Landsberg2001].

- The tangent space at any point of $(A_L \otimes A_R)P^2$ is just $(A_L \otimes A_R)^2$, the required representation space of $H$,

- Example: recall the Cayley plane $\mathbb{O}P^2$, with isometry group $F_{4(-52)}$, is a classic example:

$$F_{4(-52)}/\text{Spin}(9) \cong (\mathbb{R} \otimes \mathbb{O})P^2 = \mathbb{O}P^2$$

The tangent space at any point of $\mathbb{O}P^2$ is $\mathbb{O}^2$, the spinor of $\text{Spin}(9)$ as required.
5.6 Final result

The $\mathcal{N} > 8$ supergravities in $D = 3$ are unique, all fields belonging to the gravity multiplet, while those with $\mathcal{N} \leq 8$ may be coupled to $k$ additional matter multiplets [Marcus and Schwarz:1983; deWit, Tollsten and Nicolai:1992]. The real miracle is that tensoring left and right YM multiplets yields the field content of $\mathcal{N} = 2, 3, 4, 5, 6, 8$ supergravity with $k = 1, 1, 2, 1, 2, 4$: just the right matter content to produce the U-duality groups appearing in the magic square.
